

Design Process

Project Name: FeraMap

Reference ID: ZDO2HJYK

1. Tools Used

- Figma: UI/UX design and screen mockups
- Affinity Designer: original cat character illustration and asset creation

2. Design-First Approach

Before writing a single line of code, all major screens were designed in Figma. This allowed key UX decisions to be made visually before implementation, reducing rework during development and ensuring a consistent visual language across the entire app.

The design process followed this order:

1. Define the user flows and screen structure
2. Design each screen in Figma with real content
3. Review and identify missing screens or edge cases
4. Build based on the approved designs

3. Original Assets

The cat character illustration used throughout the app (on the login screen, success screen, and onboarding) was hand-drawn in Affinity Designer specifically for FeraMap. The illustration gives the app a unique visual identity that reflects the community and care at the heart of the product.

The pixel cat avatars used for user profile selection were generated using Gemini, then made into appropriate PNG files to be cropped and integrated into the onboarding experience. Users choose from 8 distinct pixel cat characters representing different cat breeds and colours.

4. Screen Designs

4a. Login Screen

The entry point to the app. Pink background with the hand-drawn cat illustration creates an immediately warm and distinctive first impression. Email and password fields with a prominent purple Login button.

4b. Map Screen

The app's home screen. Full-screen map with floating UI elements layered on top — search bar, filter chips, location button, report FAB, and cats nearby bottom sheet. Designed for one-handed use while standing in the field.

4c. Report Flow — 5 Steps

The core action of the app. Designed as a modal stack that slides up over the map. Each step is focused on a single decision to minimize cognitive load during field use.

Step 1 — Location: GPS pin confirmation

Step 2 — Identify: new cat or existing nearby

Step 3 — Camera: photo capture

Step 4 — Details: name, condition, notes

Info about cat

9:41

Tell us about them

All fields optional except condition.

Name
Leave blank if unsure...

Notes
Colour, behaviour, location details...

Condition

☒ Healthy ☐ Injured ☐ Sick ☐ Unknown

Report cat

Step 5 — Success: celebration with cat illustration

Cat is logged

9:41

Mimi is on the map!

The neighbourhood thanks you
You're Mimi's first spotter!

● First spotted on Calle Juárez
Just now - by you

● Waiting for more sightings...

4d. Cat Profile Screen

The emotional heart of the app. Polaroid photo stack at the top, name and zone below, stats row, AI community summary, and sighting history timeline. Designed to feel like a social profile for each cat — personal, warm, and community-authored.

4e. Colony Dashboard

The volunteer coordinator view. Stat cards at the top, overall progress bar, zone breakdown below. Clean and scannable — designed to be read quickly before heading into the field.

4f. Trap Queue

The operational view for volunteers. Priority-sorted list of cats needing attention. Urgent cases (injured/sick) surface automatically at the top. Three-button action row on each card — View profile, See on map, Claim task.

5. Key Design Decisions

- ☐ **Mobile-first:** Every screen was designed for phone dimensions before any other consideration. The app is used in the field, phone in hand, often with one thumb. Every tap target is sized accordingly.
- ☐ **Pink and purple palette:** Warm and approachable, reflecting the community-care nature of the app. Pink (#FFD9E2) backgrounds create a distinctive visual identity. Purple (#B85CE8) is used consistently for primary actions and active states.
- ☐ **Full-screen map with floating UI:** The map is the most important surface in the app. Rather than shrinking it to fit navigation elements, all UI floats on top as layers. Maximizes map visibility while keeping all controls accessible.
- ☐ **Bottom tab navigation:** Four tabs: Map, Cats, Colony, Profile. Thumb-friendly placement, standard mobile pattern, always visible. The report flow opens as a modal rather than a tab to preserve the map context.
- ☐ **Polaroid photo stack:** Multiple community photos are displayed as a stack of overlapping polaroids with slight rotations. Gives each cat a personal, human feel rather than a clinical grid of images. Tapping cycles through photos with an animation built using React Native's Animated API.
